

# **Web Design & Development**

: Introduction to HTML, CSS and JavaScript

**Syed Hussain Ali Shah Gillani**

**Lecturer, KICSIT Campus**

## Introduction to Web Design

- Web design is about making websites that look good and work well, so people enjoy using them. It includes things like how the website is laid out, the colors used, the fonts, and the images to make sure everything is easy to use and understand.
- The process involves thinking about what the website will look like, how it will be organized, and planning how the content will be shown to visitors. It's all about creating a site that's both attractive and easy for people to navigate.

## Web Development Technologies

## Introduction To Html

- **What Is HTML?**
- HTML (HyperText Markup Language) is the basic language used to create and structure web pages. It tells the web browser how to display the content on a webpage, HTML uses tags to mark different parts of the content. Each tag describes the role of that part, like headings, paragraphs, images, or links etc. For example:
- **<h1> to <h6>**: Defines headings.
- **<p>**: Defines paragraphs.
- **<img>**: Displays images.
- **<a>**: Creates links.
- HTML is the foundation of every webpage, allowing browsers to read and display content properly.
- ch as text, images, and links.

## HTML Editor

- An HTML editor is a software tool used to write and edit HTML code for creating web pages. It helps developers create the structure of a website by providing a space to write HTML, CSS, and sometimes JavaScript.

- Text-based HTML Editors:
- These editors allow you to write HTML code manually. They don't add any extra formatting, so you have complete control over the code.
- Examples include:
- Notepad++
- Sublime Text
- Visual Studio Code

## HTML ELEMENTS

- **The HTML element is everything from the start tag to the end tag:**
- <tagname>Content goes here...</tagname>
- Examples of some HTML elements:
- <h1>My First Heading</h1>

- <p>My first paragraph.</p>

## Tags

- The essence of HTML programming is tags
- A tag is a keyword enclosed by angle brackets ( Example: <i> )
- There are opening and closing tags for many but not all tags; The affected text is
- between the two tags
- The opening and closing tags use the same command except the closing tag
- contains an additional forward slash /
- For example, the expression <B> Warning </B> would cause the word 'Warning'
- to appear in bold face on a Web page

## Nested Tags

- Whenever you have HTML tags within other HTML tags, you must close the nearest tag first
- Example:
- <H1> <i> The Nation </i> </H1>

## HTML ATTRIBUTES

- All HTML elements can have attributes
- Attributes provide additional information about elements
- Attributes are always specified in the start tag
- ***Attributes usually come in name/value pairs like: name="value"***
- **The href Attribute**

`<a href="https://www.w3schools.com">Visit W3Schools</a>`

- The src Attribute

``

`<br>`

- The width and height Attributes

``

- The style Attribute

`<p style="color:red;">This is a red paragraph.</p>`

Tag Description			
<b>Basic HTML</b>			
<b>Tag</b>	<b>Def</b>	<b>Code Example</b>	<b>Browser View</b>
<!DOCTYPE>	Defines the document type	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;title&gt;Title of the document&lt;/title&gt; &lt;/head&gt;  &lt;body&gt; The content of the document..... &lt;/body&gt;  &lt;/html&gt;</pre>	The content of the document.....
<html>	Defines an HTML document/ tag represents the root of an HTML document.	<pre>&lt;!DOCTYPE html&gt; &lt;html lang="en"&gt; &lt;head&gt; &lt;title&gt;Title of the document&lt;/title&gt; &lt;/head&gt; &lt;body&gt; &lt;h1&gt;This is a heading&lt;/h1&gt; &lt;p&gt;This is a paragraph.&lt;/p&gt; &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>This is a heading</b></p> <p>This is a paragraph.</p>

<head>	<p>Contains metadata/information for the document</p> <p>The following elements can go inside the &lt;head&gt; element:</p> <ul style="list-style-type: none"> <li>&lt;title&gt; (required in every HTML document)</li> <li>&lt;style&gt;</li> <li>&lt;base&gt;</li> <li>&lt;link&gt;</li> <li>&lt;meta&gt;</li> <li>&lt;script&gt;</li> <li>&lt;noscript&gt;</li> </ul>	<pre>&lt;!DOCTYPE html&gt; &lt;html lang="en"&gt; &lt;head&gt;   &lt;title&gt;Title of the document&lt;/title&gt; &lt;/head&gt; &lt;body&gt;  &lt;h1&gt;This is a heading of HTML&lt;/h1&gt; &lt;p&gt;This is a paragraph. &lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h1>This is a heading of HTML</h1> <p>This is a paragraph.</p>
<title>	<p>Defines a title for the document</p>	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt;   &lt;title&gt;HTML Elements Reference&lt;/title&gt; &lt;/head&gt; &lt;body&gt;  &lt;h1&gt;This is a heading&lt;/h1&gt; &lt;p&gt;This is a paragraph.&lt;/p&gt;</pre>	 <h1>This is a heading</h1> <p>This is a paragraph.</p>

		<pre>&lt;/body&gt; &lt;/html&gt;</pre>	
<body>	<p>Defines the document's body</p> <p>The &lt;body&gt; element contains all the contents of an HTML document, such as headings, paragraphs, images, hyperlinks, tables, lists, etc.</p>	<pre>&lt;html&gt; &lt;head&gt;   &lt;title&gt;Title of the document&lt;/title&gt; &lt;/head&gt;  &lt;body&gt;   &lt;h1&gt;This is a heading&lt;/h1&gt;   &lt;p&gt;This is a paragraph. &lt;/p&gt; &lt;/body&gt;</pre>	<h1>This is a heading</h1> <p>This is a paragraph.</p>
<h1> to <h6>	<p>Defines HTML headings</p> <p>The &lt;h1&gt; to &lt;h6&gt; tags are used to define HTML headings.</p> <p>&lt;h1&gt; defines the most important heading. &lt;h6&gt; defines the least important heading.</p>	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;   &lt;h1&gt;This is heading 1&lt;/h1&gt;   &lt;h2&gt;This is heading 2&lt;/h2&gt;   &lt;h3&gt;This is heading 3&lt;/h3&gt;   &lt;h4&gt;This is heading 4&lt;/h4&gt;   &lt;h5&gt;This is heading 5&lt;/h5&gt;   &lt;h6&gt;This is heading 6&lt;/h6&gt; &lt;p&gt;&lt;b&gt;Tip:&lt;/b&gt; Use h1 to h6 elements only for headings. Do not use them just to make text bold or big. Use other tags for that.&lt;/p&gt; &lt;/body&gt;</pre>	<h1>This is heading 1</h1> <h2>This is heading 2</h2> <h3>This is heading 3</h3> <h4>This is heading 4</h4> <h5>This is heading 5</h5> <h6>This is heading 6</h6> <p><b>Tip:</b> Use h1 to h6 elements only for headings. Do not use them just to make text bold or big. Use other tags for that.</p>

		</html>	
<p>	Defines a paragraph The <p> tag defines a paragraph.	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The p element&lt;/h1&gt;  &lt;p&gt;This is a paragraph.&lt;/p&gt; &lt;p&gt;This is a paragraph.&lt;/p&gt; &lt;p&gt;This is a paragraph.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The p element</h2> <p>This is a paragraph.</p> <p>This is a paragraph.</p> <p>This is a paragraph.</p>
 	Inserts a single line break The   tag inserts a single line break. The   tag is an empty tag which means that it has no end tag.	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The br element&lt;/h1&gt;  &lt;p&gt;To force&lt;br&gt; line breaks&lt;br&gt; in a text,&lt;br&gt; use the br&lt;br&gt; element.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The br element</h2> <p>To force line breaks in a text, use the br element.</p>

<hr>	<p>Defines a thematic change in the content</p> <p>The &lt;hr&gt; element is most often displayed as a horizontal rule that is used to separate content (or define a change) in an HTML page.</p>	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The Main Languages of the Web&lt;/h1&gt;  &lt;p&gt;HTML is the standard markup language for creating Web pages.&lt;/p&gt;  &lt;hr&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The Main Languages of the Web</h2> <p>HTML is the standard markup language for creating Web pages.</p>

Formatting			
Tag	Def	Code Example	Browser View
<b>	Defines bold text The <b> tag specifies bold text without any extra importance.	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The b element&lt;/h1&gt;</pre>	<h2>The b element</h2> <p>This is normal text - <b>and this is bold text.</b></p>

		<pre>&lt;p&gt;This is normal text – &lt;b&gt;and this is bold text&lt;/b&gt;. &lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	
<center>	Defines centered text	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt;  &lt;body&gt;  &lt;h1&gt; &lt;center&gt;This is a heading&lt;/center&gt; &lt;/h1&gt; &lt;p&gt;This is a paragraph.&lt;/p&gt; &lt;div&gt;This is a div.&lt;/div&gt; &lt;/body&gt; &lt;/html&gt;</pre>	<p style="text-align: center;"><b>This is a heading</b></p> <p>This is a paragraph.</p> <p>This is a div.</p>
<i>	Defines a part of text in an alternate voice or mood	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The i element&lt;/h1&gt;  &lt;p&gt;&lt;i&gt;Lorem ipsum&lt;/i&gt; is the most popular filler text in history.&lt;/p&gt;</pre>	<p style="color: brown; font-size: 1.5em;"><b>The i element</b></p> <p><i>Lore ipsum</i> is the most popular filler text in history.</p> <p>The <i>RMS Titanic</i>, a luxury steamship, sank on April 15, 1912 after striking an iceberg.</p>

		<pre>&lt;p&gt;The &lt;i&gt;RMS Titanic&lt;/i&gt;, a luxury steamship, sank on April 15, 1912 after striking an iceberg. &lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	
<u>	Defines some text that is unarticulated and styled differently from normal text	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The u element&lt;/h1&gt;  &lt;p&gt;This is some &lt;u&gt;mispeled&lt;/u&gt; text.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The u element</h2> <p>This is some <u>mispeled</u> text.</p>
<strong>	Defines important text The <strong> tag is used to define text with strong importance. The content inside is typically displayed in <b>bold</b> .	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The strong element&lt;/h1&gt; &lt;p&gt;This text is normal.&lt;/p&gt;  &lt;p&gt; &lt;strong&gt;This text is important!&lt;/strong&gt; &lt;/p&gt;</pre>	<h2>The strong element</h2> <p>This text is normal.</p> <p><b>This text is important!</b></p>

		</body> </html>	
<small>	Defines smaller text	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The small element&lt;/h1&gt;  &lt;p&gt;This is some normal text.&lt;/p&gt; &lt;p&gt;&lt;small&gt;This is some smaller text.&lt;/small&gt;&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The small element</h2> <p>This is some normal text.</p> <p>This is some smaller text.</p>
<q>	Defines a short quotation	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The q element&lt;/h1&gt;  &lt;p&gt;WWF's goal is to: &lt;q&gt;Build a future where people live in harmony with nature.&lt;/q&gt; We hope they succeed.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The q element</h2> <p>WWF's goal is to: "Build a future where people live in harmony with nature." We hope they succeed.</p>

<mark>	Defines marked/highlighted text	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The mark element&lt;/h1&gt;  &lt;p&gt;Do not forget to buy &lt;mark&gt;milk&lt;/mark&gt; today.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The mark element</h2> <p>Do not forget to buy <b>milk</b> today.</p>
<abbr>	Defines an abbreviation or an acronym	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The abbr element&lt;/h1&gt;  &lt;p&gt;The &lt;abbr title="World Health Organization"&gt;WHO&lt;/abbr&gt; was founded in 1948.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The abbr element</h2> <p>The <b>WHO</b> was founded in 1948.</p> <div style="background-color: black; color: white; padding: 5px; text-align: center;">World Health Organization</div>

<em>	Defines emphasized text	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The em element&lt;/h1&gt;  &lt;p&gt;You &lt;em&gt;have&lt;/em&gt; to hurry up!&lt;/p&gt;  &lt;p&gt;We &lt;em&gt;cannot&lt;/em&gt; live like this.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The em element</h2> <p>You <i>have</i> to hurry up!</p> <p>We <i>cannot</i> live like this.</p>
<font>	Not supported in HTML5. Use CSS instead.	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;p style="font-family:verdana"&gt;This is a paragraph.&lt;/p&gt; &lt;p style="font-family:'Courier New'"&gt;This is another paragraph.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p>This is a paragraph.</p> <p>This is another paragraph.</p>

<strike>	Not supported in HTML5. Use <del> or <s> instead. Defines strikethrough text	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The del element&lt;/h1&gt;  &lt;p&gt;My favorite color is &lt;del&gt;blue&lt;/del&gt; &lt;ins&gt;red&lt;/ins&gt;!&lt;/p&gt;</pre>	<h2>The del element</h2> <p>My favorite color is <del>blue</del> <ins>red</ins>!</p>
<var>	Defines a variable	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The var element&lt;/h1&gt;  &lt;p&gt;The area of a triangle is: <math>1/2 \times b \times h</math>, where <math>b</math> is the base, and <math>h</math> is the vertical height.&lt;/p&gt;</pre>	<h2>The var element</h2> <p>The area of a triangle is: <math>1/2 \times b \times h</math>, where <math>b</math> is the base, and <math>h</math> is the vertical height.</p>

List			
Tag	Def	Code Example	Browser View
<menu>	Defines an alternative unordered list	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The menu element&lt;/h1&gt;  &lt;menu&gt;   &lt;li&gt;Coffee&lt;/li&gt;   &lt;li&gt;Tea&lt;/li&gt;   &lt;li&gt;Milk&lt;/li&gt; &lt;/menu&gt;</pre>	<p><b>The menu element</b></p> <ul style="list-style-type: none"> <li>• Coffee</li> <li>• Tea</li> <li>• Milk</li> </ul>

		</body> </html>	
<ul>	Defines an unordered list Use the <ul> tag together with the <li> tag to create unordered lists.	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;h1&gt;The ul element&lt;/h1&gt; &lt;ul&gt; &lt;li&gt;Coffee&lt;/li&gt; &lt;li&gt;Tea&lt;/li&gt; &lt;li&gt;Milk&lt;/li&gt; &lt;/ul&gt; &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The ul element</h2> <ul style="list-style-type: none"> <li>• Coffee</li> <li>• Tea</li> <li>• Milk</li> </ul>

<pre>&lt;ol&gt;</pre>	<p>Defines an ordered list. The &lt;li&gt; tag is used to define each list item. An ordered list can be numerical or alphabetical.</p>	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;h1&gt;The ol element&lt;/h1&gt;  &lt;ol&gt; &lt;li&gt;Coffee&lt;/li&gt; &lt;li&gt;Tea&lt;/li&gt; &lt;li&gt;Milk&lt;/li&gt; &lt;/ol&gt;</pre> <pre>&lt;ol start="50"&gt; &lt;li&gt;Coffee&lt;/li&gt; &lt;li&gt;Tea&lt;/li&gt; &lt;li&gt;Milk&lt;/li&gt; &lt;/ol&gt;</pre> <p><b>Numbered</b></p> <pre>&lt;ol&gt; &lt;li&gt;List item 1&lt;/li&gt; &lt;li&gt;List item 2&lt;/li&gt; &lt;li&gt;List item 3&lt;/li&gt; &lt;li&gt;List item 4&lt;/li&gt; &lt;/ol&gt;</pre> <p><b>Numbered Special Start</b></p> <pre>&lt;ol start="5"&gt;</pre>	<h2>The ol element</h2> <p>1. Coffee 2. Tea 3. Milk</p> <p>50. Coffee 51. Tea 52. Milk</p> <p>Numbered</p> <p>1. List item 1 2. List item 2 3. List item 3 4. List item 4</p> <p>Numbered Special Start</p> <p>5. List item 1 6. List item 2 7. List item 3 8. List item 4</p> <p>Lowercase Letters</p> <p>a. List item 1 b. List item 2 c. List item 3 d. List item 4</p> <p>Capital Letters</p> <p>A. List item 1 B. List item 2 C. 		<pre>&lt;/ul&gt;  &lt;/body&gt; &lt;/html&gt;</pre>					
<dl>	Defines a description list	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The dl, dd, and dt elements&lt;/h1&gt;  &lt;p&gt;These three elements are used to create a description list:&lt;/p&gt;  &lt;dl&gt; &lt;dt&gt;Coffee&lt;/dt&gt; &lt;dd&gt;Black hot drink&lt;/dd&gt; &lt;dt&gt;Milk&lt;/dt&gt; &lt;dd&gt;White cold drink&lt;/dd&gt; &lt;/dl&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The dl, dd, and dt elements</h2> <p>These three elements are used to create a description list:</p> <table> <tbody> <tr> <td>Coffee</td> <td>Black hot drink</td> </tr> <tr> <td>Milk</td> <td>White cold drink</td> </tr> </tbody> </table>	Coffee	Black hot drink	Milk	White cold drink
Coffee	Black hot drink						
Milk	White cold drink						
<dt>	Defines a term/name in a description list						

<dd>	Defines a description of a term/name in a description list		

Image/Audio/Video			
Tag	Def	Code Example	Browser View
<img>	<p>Defines an image Images are not technically inserted into a web page; images are linked to web pages. The &lt;img&gt; tag creates a holding space for the referenced image.</p> <p>The &lt;img&gt; tag has two required attributes:</p> <ul style="list-style-type: none"> <li>src - Specifies the path to the image</li> <li>alt - Specifies an alternate text for the image, if the image for some reason cannot be displayed</li> </ul>	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The img element&lt;/h1&gt;  &lt;img src="img_girl.jpg" alt="Girl in a jacket" width="200" height="200"&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>The img element</b></p> 

<figcaption>	Defines a caption for a <figure> element	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;h1&gt;The figure and figcaption element&lt;/h1&gt; &lt;figure&gt;   &lt;img src=" img_girl.jpg " alt="Trulli" style="width:100%"&gt; &lt;figcaption&gt;Fig.1 - Trulli, Puglia, Italy.&lt;/figcaption&gt; &lt;/figure&gt; &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The figure and figcaption element</h2>  <p>Fig.1 - Trulli, Puglia, Italy.</p>
<audio>	Defines sound content	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;h1&gt;The audio element&lt;/h1&gt; &lt;p&gt;Click on the play button to play a sound:&lt;/p&gt;  &lt;audio controls&gt;   &lt;source src="horse.ogg" type="audio/ogg"&gt;   &lt;source src="horse.mp3" type="audio/mpeg"&gt;   Your browser does not support the audio element. &lt;/audio&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The audio element</h2> <p>Click on the play button to play a sound:</p> <div data-bbox="1571 905 2177 1000"> <span>▶ 0:00 / 0:01</span> <span>—</span> <span>🔇</span> <span>⋮</span> </div>

<source>	Defines multiple media resources for media elements (<video>, <audio> and <picture>)	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;h1&gt;The source element&lt;/h1&gt; &lt;p&gt;Click on the play button to play a sound:&lt;/p&gt;  &lt;audio controls&gt; &lt;source src="horse.ogg" type="audio/ogg"&gt; &lt;source src="horse.mp3" type="audio/mpeg"&gt; Your browser does not support the audio element. &lt;/audio&gt; &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The source element</h2> <p>Click on the play button to play a sound:</p> 
<video>	Defines a video or movie	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;h1&gt;The video element&lt;/h1&gt;  &lt;video width="320" height="240" controls&gt; &lt;source src="movie.mp4" type="video/mp4"&gt; &lt;source src="movie.ogv" type="video/ogv"&gt; Your browser does not support the video tag. &lt;/video&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The video element</h2> 

## Links

Tag	Def	Code Example	Browser View
<a>	Defines a hyperlink The <a> tag defines a hyperlink, which is used to link from one page to another.	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The a element&lt;/h1&gt;  &lt;a href="https://www.w3schools.com"&gt;Visit W3Schools.com!&lt;/a&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<b>The a element</b> <p><a href="https://www.w3schools.com">Visit W3Schools.com!</a></p>
<link>	Defines the relationship between a document and an external resource (most used to link to style sheets)	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;link rel="stylesheet" href="styles.css"&gt; &lt;/head&gt; &lt;body&gt;  &lt;h1&gt;Hello World!&lt;/h1&gt;  &lt;h2&gt;I am formatted with a linked style sheet.&lt;/h2&gt;</pre>	<p><b>Hello World!</b></p> <p>I am formatted with a linked style sheet.</p> <p>Me too!</p>

		<pre>&lt;p&gt;Me too!&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	
<nav>	Defines navigation links	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1&gt;The nav element&lt;/h1&gt;  &lt;p&gt;The nav element defines a set of navigation links:&lt;/p&gt;  &lt;nav&gt; &lt;a href="/html/"&gt;HTML&lt;/a&gt;   &lt;a href="/css/"&gt;CSS&lt;/a&gt;   &lt;a href="/js/"&gt;JavaScript&lt;/a&gt;   &lt;a href="/python/"&gt;Python&lt;/a&gt; &lt;/nav&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The nav element</h2> <p>The nav element defines a set of navigation links:</p> <p><a href="#">HTML</a>   <a href="#">CSS</a>   <a href="#">JavaScript</a>   <a href="#">Python</a></p>

## Table

Tag	Def	Code Example	Browser View						
<table>	Defines a table An HTML table consists of one <table> element and one or more <tr>, <th>, and <td> elements.	<pre>&lt;html&gt; &lt;head&gt; &lt;style&gt; table, th, td {   border: 1px solid black; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt;  &lt;h1&gt;The table element&lt;/h1&gt;  &lt;table&gt; &lt;tr&gt; &lt;th&gt;Month&lt;/th&gt; &lt;th&gt;Savings&lt;/th&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;January&lt;/td&gt; &lt;td&gt;\$100&lt;/td&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;February&lt;/td&gt;</pre>	<h2>The table element</h2> <table border="1"><thead><tr><th>Month</th><th>Savings</th></tr></thead><tbody><tr><td>January</td><td>\$100</td></tr><tr><td>February</td><td>\$80</td></tr></tbody></table>	Month	Savings	January	\$100	February	\$80
Month	Savings								
January	\$100								
February	\$80								

```
<td>$80</td>  
</tr>  
</table>
```

```
</body>  
</html>
```

<caption> Defines a table caption

```
<!DOCTYPE html>  
<html>  
<head>  
<style>  
table, th, td {  
    border: 1px solid black;  
}  
</style>  
</head>  
<body>  
  
<h1>The caption element</h1>  
  
<table>  
    <caption>Monthly savings</caption>  
    <tr>  
        <th>Month</th>  
        <th>Savings</th>  
    </tr>  
    <tr>
```

## The caption element

Monthly savings

Month	Savings
January	\$100
February	\$50

```

<td>January</td>
<td>$100</td>
</tr>
<tr>
<td>February</td>
<td>$50</td>
</tr>
</table>

</body>
</html>

```

<th>

Defines a header cell in a table  
The <th> tag defines a header cell in an HTML table.

```

<!DOCTYPE html>
<html>
<head>
<style>
table, th, td {
  border: 1px solid black;
}
</style>
</head>
<body>

<h1>The th element</h1>

<p>The th element defines a header cell in a table:</p>

```

## The th element

The th element defines a header cell in a table:

Month	Savings
January	\$100
February	\$80

```

<table>
  <tr>
    <th>Month</th>
    <th>Savings</th>
  </tr>
  <tr>
    <td>January</td>
    <td>$100</td>
  </tr>
  <tr>
    <td>February</td>
    <td>$80</td>
  </tr>
</table>

</body>
</html>

```

<tr>

Defines a row in a table  
The <tr> tag defines a row in an HTML table.  
A <tr> element contains one or more <th> or <td> elements.

```

<!DOCTYPE html>
<html>
<head>
<style>
table, th, td {
  border: 1px solid black;
}
</style>
</head>

```

## The tr element

The tr element defines a row in a table:

Month	Savings
January	\$100
February	\$80

```
<body>

<h1>The tr element</h1>

<p>The tr element defines a row in a table:</p>

<table>
  <tr>
    <th>Month</th>
    <th>Savings</th>
  </tr>
  <tr>
    <td>January</td>
    <td>$100</td>
  </tr>
  <tr>
    <td>February</td>
    <td>$80</td>
  </tr>
</table>

</body>
</html>
```

<td>	<p>Defines a cell in a table. The &lt;td&gt; tag defines a standard data cell in an HTML table.</p> <p>An HTML table has two kinds of cells:</p> <ul style="list-style-type: none"> <li>• Header cells - contains header information (created with the &lt;th&gt; element)</li> <li>• Data cells - contains data (created with the &lt;td&gt; element)</li> </ul>	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; table, th, td {   border: 1px solid black; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt; &lt;h1&gt;The td element&lt;/h1&gt; &lt;p&gt;The td element defines a cell in a table:&lt;/p&gt;  &lt;table&gt; &lt;tr&gt; &lt;td&gt;Cell A&lt;/td&gt; &lt;td&gt;Cell B&lt;/td&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;Cell C&lt;/td&gt; &lt;td&gt;Cell D&lt;/td&gt; &lt;/tr&gt; &lt;/table&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<h2>The td element</h2> <p>The td element defines a cell in a table:</p> <table border="1" data-bbox="1567 425 1804 541"> <tr> <td>Cell A</td><td>Cell B</td></tr> <tr> <td>Cell C</td><td>Cell D</td></tr> </table>	Cell A	Cell B	Cell C	Cell D
Cell A	Cell B						
Cell C	Cell D						

```
<thead>
```

Groups the header content in a table

```
<!DOCTYPE html>
<html>
<head>
<style>
table, th, td {
  border: 1px solid black;
}
</style>
</head>
<body>

<h1>The thead, tbody, and tfoot elements</h1>

<table>
<thead>
<tr>
<th>Month</th>
<th>Savings</th>
</tr>
</thead>
<tbody>
<tr>
<td>January</td>
<td>$100</td>
</tr>
<tr>
```

## The thead, tbody, and tfoot elements

Month	Savings
January	\$100
February	\$80
Sum	\$180

```

<td>February</td>
<td>$80</td>
</tr>
</tbody>
<tfoot>
<tr>
<td>Sum</td>
<td>$180</td>
</tr>
</tfoot>
</table>

</body>
</html>

```

<tbody> Groups the body content in a table

<tfoot> Groups the footer content in a table

<colgroup> Specifies a group of one or more columns in a table for formatting

```

<!DOCTYPE html>
<html>
<head>
<style>
table, th, td {
    border: 1px solid black;
}
</style>

```

## The colgroup element

ISBN	Title	Price
3476896	My first HTML	\$53
5869207	My first CSS	\$49

```
</head>
<body>

    <h1>The colgroup element</h1>

    <table>
        <colgroup>
            <col span="2" style="background-color:red">
            <col style="background-color:yellow">
        </colgroup>

Oslo has over 600.000 inhabitants.         </td> <td style="background-color: #D9EEE1; padding: 5px;"> <b>Rome</b>            Rome is the capital city of Italy.            Rome has almost 3 million inhabitants.         </td> </tr> </table>	<b>London</b> London is the capital city of England. London has over 13 million inhabitants.	<b>Oslo</b> Oslo is the capital city of Norway. Oslo has over 600.000 inhabitants.	<b>Rome</b> Rome is the capital city of Italy. Rome has almost 3 million inhabitants.
<b>London</b> London is the capital city of England. London has over 13 million inhabitants.	<b>Oslo</b> Oslo is the capital city of Norway. Oslo has over 600.000 inhabitants.	<b>Rome</b> Rome is the capital city of Italy. Rome has almost 3 million inhabitants.			

```
<div style="background-color:#FFF4A3;">
  <h2>London</h2>
  <p>London is the capital city of England.</p>
  <p>London has over 13 million inhabitants.</p>
</div>

<div style="background-color:#FFC0C7;">
  <h2>Oslo</h2>
  <p>Oslo is the capital city of Norway.</p>
  <p>Oslo has over 600.000 inhabitants.</p>
</div>

<div style="background-color:#D9EEE1;">
  <h2>Rome</h2>
  <p>Rome is the capital city of Italy.</p>
  <p>Rome has almost 3 million inhabitants.</p>
</div>

</body>
</html>
```

## Flex

The CSS Flexbox Layout Module was introduced to make it easier to design flexible responsive layout structure without using float or positioning.

To make the CSS flex method work, surround the `<div>` elements with another `<div>` element and give it the status as a flex container.

```
<!DOCTYPE html>
<html>
<head>
<style>
.mycontainer {
  display: flex;
}
.mycontainer > div {
  width:33%;
}
</style>
</head>
<body>

<h1>Flexbox Example</h1>

<p>Align three DIV elements side by side.</p>

<div class="mycontainer">

<div style="background-color:#FFF4A3;">
<h2>London</h2>
<p>London is the capital city of England.</p>
<p>London has over 13 million inhabitants.</p>
</div>

<div style="background-color:#FFC0C7;">
<h2>Oslo</h2>
<p>Oslo is the capital city of Norway.</p>
<p>Oslo has over 600.000 inhabitants.</p>
</div>

<div style="background-color:#D9EAD3;">
<h2>Rome</h2>
<p>Rome is the capital city of Italy.</p>
<p>Rome has almost 3 million inhabitants.</p>
</div>
</div>
</body>
</html>
```

## Flexbox Example

Align three DIV elements side by side.

### London

London is the capital city of England.

London has over 13 million inhabitants.

### Oslo

Oslo is the capital city of Norway.

Oslo has over 600.000 inhabitants.

### Rome

Rome is the capital city of Italy.

Rome has almost 3 million inhabitants.

```

</div>

<div style="background-color:#D9EEE1;">
  <h2>Rome</h2>
  <p>Rome is the capital city of Italy.</p>
  <p>Rome has almost 3 million.</p>
</div>

```

```
</div>
```

```

</body>
</html>

```

## Grid

The CSS Grid Layout Module offers a grid-based layout system, with rows and columns, making it easier to design web pages without having to use floats and positioning.

Sounds almost the same as flex, but has the ability to define more than one row and position each row individually.

The CSS grid method requires that you surround the `<div>` elements with another `<div>` element and give the status as a grid container, and you

```

<!DOCTYPE html>
<html>
<head>
<style>
.grid-container {
  display: grid;
  grid-template-columns: 33% 33% 33%;
}
</style>
</head>
<body>

```

```
<h1>Grid Example</h1>
```

```

<p>Align three DIV elements side by side.</p>

```

## Grid Example

Align three DIV elements side by side.

London	Oslo	Rome
London is the capital city of England.	Oslo is the capital city of Norway.	Rome is the capital city of Italy.
London has over 13 million inhabitants.	Oslo has over 600.000 inhabitants.	Rome has almost 3 million inhabitants.

must specify the width of each column.

```
<div class="grid-container">

<div style="background-color:#FFF4A3;">
  <h2>London</h2>
  <p>London is the capital city of England.</p>
  <p>London has over 13 million inhabitants.</p>
</div>

<div style="background-color:#FFC0C7;">
  <h2>Oslo</h2>
  <p>Oslo is the capital city of Norway.</p>
  <p>Oslo has over 600.000 inhabitants.</p>
</div>

<div style="background-color:#D9EEE1;">
  <h2>Rome</h2>
  <p>Rome is the capital city of Italy.</p>
  <p>Rome has almost 3 million inhabitants.</p>
</div>

</div>

</body>
</html>
```

# CSS Introduction

CSS is the language we use to style a Web page.

## What is CSS?

- CSS stands for Cascading Style Sheets
- CSS describes how HTML elements are to be displayed on screen, paper, or in other media
- CSS saves a lot of work. It can control the layout of multiple web pages all at once
- External stylesheets are stored in CSS files

## Why Use CSS?

- CSS is used to define styles for your web pages, including the design, layout and variations in display for different devices and screen sizes.

## Example:

### Code

```
<!DOCTYPE html>
<html>
<head>
<style>

body {
  background-color: lightblue;
}

h1 {
  color: white;
  text-align: center;
}

p {
  font-family: verdana;
  font-size: 20px;
}

</style>
</head>
<body>

<h1>My First CSS Example</h1>
```

### Browser View

My First CSS Example

This is a paragraph.

```
<p>This is a paragraph.</p>
</body>
</html>
```

## CSS Syntax

- The selector points to the HTML element you want to style.
- The declaration block contains one or more declarations separated by semicolons.
- Each declaration includes a CSS property name and a value, separated by a colon.
- Multiple CSS declarations are separated with semicolons, and declaration blocks are surrounded by curly braces.

## Example

In this example all <p> elements will be center-aligned, with a red text color:

```
p {  
    color: red;  
    text-align: center;  
}
```

## Example Explained

- p is a selector in CSS (it points to the HTML element you want to style: <p>).
- color is a property, and red is the property value
- text-align is a property, and center is the property value

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; p {     color: red;     text-align: center; } &lt;/style&gt; &lt;/head&gt;</pre>	<p>Hello World!</p> <p>These paragraphs are styled with CSS.</p>

```
<body>  
  
<p>Hello World!</p>  
<p>These paragraphs are styled with CSS.</p>  
  
</body>  
</html>
```

## CSS Selectors

A CSS selector selects the HTML element(s) you want to style.

### The CSS element Selector

#### Example

Here, all `<p>` elements on the page will be center-aligned, with a red text color:

```
p {  
    text-align: center;  
    color: red;  
}
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; p {   text-align: center;   color: red; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt;  &lt;p&gt;Every paragraph will be affected by the style.&lt;/p&gt; &lt;p id="para1"&gt;Me too!&lt;/p&gt; &lt;p&gt;And me!&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p>Every paragraph will be affected by the style.</p> <p>Me too!</p> <p>And me!</p>

## The CSS id Selector

- The id selector uses the id attribute of an HTML element to select a specific element.
- The id of an element is unique within a page, so the id selector is used to select one unique element!
- To select an element with a specific id, write a hash (#) character, followed by the id of the element.

### Example

The CSS rule below will be applied to the HTML element with id="para1":

```
#para1 {  
    text-align: center;  
    color: red;  
}
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; #para1 {     text-align: center;     color: red; }</pre>	<p>Hello World!</p> <p>This paragraph is not affected by the style.</p>

```
}
```

```
</style>
```

```
</head>
```

```
<body>
```

```
<p id="para1">Hello World!</p>
```

```
<p>This paragraph is not affected by the style.</p>
```

```
</body>
```

```
</html>
```

## The CSS class Selector

- The class selector selects HTML elements with a specific class attribute.
- To select elements with a specific class, write a period (.) character, followed by the class name.

### Example1

In this example all HTML elements with class="center" will be red and center-aligned:

```
.center {
```

```
    text-align: center;
```

```
    color: red;
```

```
}
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; .center {   text-align: center;   color: red; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt;  &lt;h1 class="center"&gt;Red and center-aligned heading&lt;/h1&gt;  &lt;p class="center"&gt;Red and center-aligned paragraph.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p>Red and center-aligned heading</p> <p>Red and center-aligned paragraph.</p>

## Example2

In this example only `<p>` elements with `class="center"` will be red and center-aligned:

```
p.center {
  text-align: center;
  color: red;
}
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; p.center {     text-align: center;     color: red; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt;  &lt;h1 class="center"&gt;This heading will not be affected&lt;/h1&gt;  &lt;p class="center"&gt;This paragraph will be red and center-aligned.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>This heading will not be affected</b></p> <p>This paragraph will be red and center-aligned.</p>

### Example3

In this example the `<p>` element will be styled according to `class="center"` and to `class="large"`:

`<p class="center large">This paragraph refers to two classes.</p>`

Code	Browser View
<pre data-bbox="206 260 493 1333">&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; p.center {   text-align: center;   color: red; }  p.large {   font-size: 300%; }  &lt;/style&gt; &lt;/head&gt; &lt;body&gt;  &lt;h1 class="center"&gt;This heading will not be affected&lt;/h1&gt; &lt;p class="center"&gt;This paragraph will be red and center-aligned.&lt;/p&gt; &lt;p class="center large"&gt;This paragraph will be red, center-aligned, and in a large font-size.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p data-bbox="1131 260 1409 298"><b>This heading will not be affected</b></p> <p data-bbox="1198 473 1796 511">This paragraph will be red and center-aligned.</p> <p data-bbox="1198 620 1796 1140">This paragraph will be red, center-aligned, and in a large font-size.</p>

# The CSS Universal Selector

- The universal selector (\*) selects all HTML elements on the page.

## Example

The CSS rule below will affect every HTML element on the page:

```
* {  
    text-align: center;  
    color: blue;  
}
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; * {     text-align: center;     color: blue; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt;</pre>	<p data-bbox="1140 838 1416 879"><b>Hello world!</b></p> <p data-bbox="1169 1033 1820 1105">Every element on the page will be affected by the style.</p> <p data-bbox="1432 1144 1551 1170">Me too!</p> <p data-bbox="1432 1216 1551 1241">And me!</p>

```
<h1>Hello world!</h1>

<p>Every element on the page will be affected by the
style.</p>
<p id="para1">Me too!</p>
<p>And me!</p>

</body>
</html>
```

## The CSS Grouping Selector

- The grouping selector selects all the HTML elements with the same style definitions.
- Look at the following CSS code (the h1, h2, and p elements have the same style definitions):

```
h1 {
  text-align: center;
  color: red;
}

h2 {
  text-align: center;
  color: red;
}

p {
  text-align: center;
```

```
    color: red;  
}
```

It will be better to group the selectors, to minimize the code.

To group selectors, separate each selector with a comma.

## Example

In this example we have grouped the selectors from the code above:

```
h1, h2, p {  
    text-align: center;  
    color: red;  
}
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; h1, h2, p {     text-align: center;     color: red; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt;</pre>	<p><b>Hello World!</b></p> <p><b>Smaller heading!</b></p> <p>This is a paragraph.</p>

```
<h1>Hello World!</h1>
<h2>Smaller heading!</h2>
<p>This is a paragraph.</p>
</body>
</html>
```

# How To Add CSS

When a browser reads a style sheet, it will format the HTML document according to the information in the style sheet.

## Three Ways to Insert CSS

There are three ways of inserting a style sheet:

- Inline CSS
- Internal CSS
- External CSS

## Inline CSS

- An inline style may be used to apply a unique style for a single element.
- To use inline styles, add the style attribute to the relevant element. The style attribute can contain any CSS property.

### Example

Inline styles are defined within the "style" attribute of the relevant element:

```
<!DOCTYPE html>
<html>
<body>

<h1 style="color:blue;text-align:center;">This is a heading</h1>
<p style="color:red;">This is a paragraph.</p>

</body>
</html>
```

Code	Browser View
<pre data-bbox="204 260 1104 638">&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h1 style="color:blue;text-align:center;"&gt;This is a heading&lt;/h1&gt;  &lt;p style="color:red;"&gt;This is a paragraph.&lt;/p&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p data-bbox="1252 298 1724 362"><b>This is a heading</b></p> <p data-bbox="1131 409 1378 441">This is a paragraph.</p>

## Internal CSS

- An internal style sheet may be used if one single HTML page has a unique style.
- The internal style is defined inside the `<style>` element, inside the head section.

### Example

Internal styles are defined within the `<style>` element, inside the `<head>` section of an HTML page:

```
<!DOCTYPE html>
<html>
<head>
<style>
body {
```

```
background-color: linen;  
}  
  
h1 {  
    color: maroon;  
    margin-left: 40px;  
}  
/>/style>  
/>/head>  
<body>  
  
<h1>This is a heading</h1>  
<p>This is a paragraph.</p>  
</body>  
</html>
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; body {     background-color: linen; }  h1 {     color: maroon;     margin-left: 40px; }</pre>	<p>This is a heading</p> <p>This is a paragraph.</p>

```
</style>
</head>
<body>

<h1>This is a heading</h1>
<p>This is a paragraph.</p>

</body>
</html>
```

## External CSS

- With an external style sheet, you can change the look of an entire website by changing just one file!
- Each HTML page must include a reference to the external style sheet file inside the `<link>` element, inside the `head` section.

## Example

External styles are defined within the `<link>` element, inside the `<head>` section of an HTML page:

```
<!DOCTYPE html>
<html>
<head>
<link rel="stylesheet" href="mystyle.css">
</head>
<body>

<h1>This is a heading</h1>
```

```
<p>This is a paragraph.</p>  
  
</body>  
</html>
```

- An external style sheet can be written in any text editor, and must be saved with a .css extension.
- The external .css file should not contain any HTML tags.
- Here is how the "mystyle.css" file looks:

## "mystyle.css"

```
body {  
    background-color: lightblue;  
}  
  
h1 {  
    color: navy;  
    margin-left: 20px;  
}
```

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt;     &lt;head&gt;         &lt;link rel="stylesheet" href="mystyle.css"&gt;     &lt;/head&gt;     &lt;body&gt;</pre>	<p>This is a heading</p> <p>This is a paragraph.</p>

```
<h1>This is a heading</h1>
<p>This is a paragraph.</p>

</body>
</html>
```

## Multiple Style Sheets

If some properties have been defined for the same selector (element) in different style sheets, the value from the last read style sheet will be used.

Assume that an **external style sheet** has the following style for the `<h1>` element:

```
h1 {
  color: navy;
}
```

Then, assume that an **internal style sheet** also has the following style for the `<h1>` element:

```
h1 {
  color: orange;
}
```

### Example

If the internal style is defined **after** the link to the external style sheet, the `<h1>` elements will be "orange":

```
<head>
<link rel="stylesheet" type="text/css" href="mystyle.css">
<style>
h1 {
  color: orange;
}
</style>
</head>
```

[Try it Yourself »](#)

## Example

However, if the internal style is defined **before** the link to the external style sheet, the <h1> elements will be "navy":

```
<head>
<style>
h1 {
  color: orange;
}
</style>
<link rel="stylesheet" type="text/css" href="mystyle.css">
</head>
```

[Try it Yourself »](#)

<b>CSS Border Width</b>	<pre> p.one {     border-style: solid;     border-width: 5px; }  p.two {     border-style: solid;     border-width: medium; }  p.three {     border-style: dotted;     border-width: 2px; } </pre>	

	<pre>}</pre> <pre>p.four {     border-style: dotted;     border-width: thick; }</pre>	
	<pre>p.one {     border-style: solid;     border-width: 5px 20px; /* 5px top and bottom, 20px on the sides */ }  p.two {     border-style: solid;     border-width: 20px 5px; /* 20px top and bottom, 5px on the sides */ }  p.three {     border-style: solid;     border-width: 25px 10px 4px 35px; /* 25px top, 10px right, 4px bottom and 35px left */ }</pre>	

## CSS Border Color

```
p.one {  
    border-style: solid;  
    border-color: red;  
}  
  
p.two {  
    border-style: solid;  
    border-color: green;  
}  
  
p.three {  
    border-style: dotted;  
    border-color: blue;  
}
```

## CSS Margins

## CSS Margins

The CSS `margin` properties are used to create space around elements, outside of any defined borders.

With CSS, you have full control over the margins. There are properties for setting the margin for each side of an element (top, right, bottom, and left).

### Margin - Individual Sides

CSS has properties for specifying the margin for each side of an element:

- `margin-top`
- `margin-right`
- `margin-bottom`
- `margin-left`

All the margin properties can have the following values:

- `auto` - the browser calculates the margin
- `length` - specifies a margin in px, pt, cm, etc.
- `%` - specifies a margin in % of the width of the containing element
- `inherit` - specifies that the margin should be inherited from the parent element

**Tip:** Negative values are allowed.

```
<style>
div {
    margin: 70px;
    border: 1px solid #4CAF50;
}
</style>
```

CSS Margins

This element has a margin of 70px.

## Margin - Individual Sides

CSS has properties for specifying the margin for each side of an element:

- `margin-top`
- `margin-right`
- `margin-bottom`
- `margin-left`

All the margin properties can have the following values:

- `auto` - the browser calculates the margin
- `length` - specifies a margin in px, pt, cm, etc.
- `%` - specifies a margin in % of the width of the containing element
- `inherit` - specifies that the margin should be inherited from the parent element

**Tip:** Negative values are allowed.

```
p {  
    margin-top: 100px;  
    margin-bottom: 100px;  
    margin-right: 150px;  
    margin-left: 80px;  
}
```

```
<style>  
div {  
    border: 1px solid black;  
    margin-top: 100px;  
    margin-bottom: 100px;  
    margin-right: 150px;  
    margin-left: 80px;  
    background-color: lightblue;  
}  
</style>
```

## Using individual margin properties

This div element has a top margin of 100px, a right margin of 150px, a bottom margin of 100px, and a left margin of 80px.

## Margin - Shorthand Property

To shorten the code, it is possible to specify all the margin properties in one property.

The `margin` property is a shorthand property for the following individual margin properties:

- `margin-top`
- `margin-right`
- `margin-bottom`
- `margin-left`

So, here is how it works:

If the `margin` property has four values:

- **`margin: 25px 50px 75px 100px;`**
  - top margin is 25px
  - right margin is 50px

```
p {  
    margin: 25px 50px 75px 100px;  
}
```

```
<!DOCTYPE html>  
<html>  
<head>  
<style>  
div {  
    border: 1px solid black;  
    margin: 25px 50px 75px 100px;  
    background-color: lightblue;  
}  
</style>  
</head>  
<body>
```

```
<h2>The margin shorthand  
property - 4 values</h2>
```

```
<div>This div element has a top margin  
of 25px, a right margin of 50px, a bottom  
margin of 75px, and a left margin of  
100px.</div>
```

```
<hr>  
</body>  
</html>
```

## The margin shorthand property - 4 values

This div element has a top margin of 25px, a right margin of 50px, a bottom margin of 75px, and a left margin of 100px.

<ul style="list-style-type: none"><li>○ bottom margin is 75px</li><li>○ left margin is 100px</li></ul>		
	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;style&gt; div {   margin: 70px;   border: 1px solid #4CAF50; } &lt;/style&gt; &lt;/head&gt; &lt;body&gt;  &lt;h2&gt;CSS Margins&lt;/h2&gt;  &lt;div&gt;This element has a margin of 70px.&lt;/div&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>CSS Margins</b></p> <p>This element has a margin of 70px.</p>

## CSS Padding

The CSS `padding` properties are used to generate space around an element's content, inside of any defined borders.

With CSS, you have full control over the padding. There are properties for setting the padding for each side of an element (top, right, bottom, and left).

### Padding - Individual Sides

CSS has properties for specifying the padding for each side of an element:

- `padding-top`
- `padding-right`
- `padding-bottom`

```
<!DOCTYPE html>
<html>
<head>
<style>
div {
    border: 1px solid black;
    background-color: lightblue;
    padding-top: 50px;
    padding-right: 30px;
    padding-bottom: 50px;
    padding-left: 80px;
}
</style>
</head>
<body>

<h2>Using individual padding properties</h2>

<div>This div element has a top padding of 50px, a right padding of 30px, a bottom padding of 50px, and a left padding of 80px.</div>

</body>
</html>
```

### Using individual padding properties

This div element has a top padding of 50px, a right padding of 30px, a bottom padding of 50px, and a left padding of 80px.

- **padding-left**

All the padding properties can have the following values:

- *length* - specifies a padding in px, pt, cm, etc.
- *%* - specifies a padding in % of the width of the containing element
- *inherit* - specifies that the padding should be inherited from the parent element

**Note:** Negative values are not allowed.

## Padding - Shorthand Property

To shorten the code, it is possible to specify all the padding properties in one property.

The `padding` property is a shorthand property for the following individual padding properties:

- `padding-top`
- `padding-right`
- `padding-bottom`
- `padding-left`

So, here is how it works:

If the `padding` property has four values:

- **`padding: 25px 50px 75px 100px;`**
  - top padding is 25px
  - right padding is 50px

```
<!DOCTYPE html>
<html>
<head>
<style>
div {
  border: 1px solid black;
  padding: 25px 50px 75px 100px;
  background-color: lightblue;
}
</style>
</head>
<body>
```

`<h2>The padding shorthand property - 4 values</h2>`

`<div>This div element has a top padding of 25px, a right padding of 50px, a bottom padding of 75px, and a left padding of 100px.</div>`

```
</body>
</html>
```

## The padding shorthand property - 4 values

This div element has a top padding of 25px, a right padding of 50px, a bottom padding of 75px, and a left padding of 100px.

- bottom padding is 75px
- left padding is 100px

## CSS Setting height and width

The `height` and `width` properties are used to set the height and width of an element.

The height and width properties do not include padding, borders, or margins. It sets the height/width of the area inside the padding, border, and margin of the element.

### CSS height and width Values

The `height` and `width` properties may have the following values:

- `auto` - This is default. The browser calculates

```
<!DOCTYPE html>
<html>
<head>
<style>
div {
  height: 200px;
  width: 50%;
  background-color: powderblue;
}
</style>
</head>
<body>

<h2>Set the height and width of an element</h2>

<div>This div element has a height of 200px and a width of 50%.</div>

</body>
</html>
```

## Set the height and width of an element

This div element has a height of 200px and a width of 50%.

<p>the height and width</p> <ul style="list-style-type: none"><li>• <b>length</b> - Defines the height/width in px, cm, etc.</li><li>• <b>%</b> - Defines the height/width in percent of the containing block</li><li>• <b>initial</b> - Sets the height/width to its default value</li><li>• <b>inherit</b> - The height/width will be inherited from its parent value</li></ul>		
---	--	--

## Setting max-width

The `max-width` property is used to set the maximum width of an element.

```
<!DOCTYPE html>
<html>
<head>
<style>
div {
  max-width: 500px;
  height: 100px;
  background-color: powderblue;
}
</style>
</head>
<body>

<h2>Set the max-width of an element</h2>

<div>This div element has a height of 100px and a max-width of 500px.</div>

<p>Resize the browser window to see the effect.</p>

</body>
</html>
```

## Set the max-width of an element

This div element has a height of 100px and a max-width of 500px.

Resize the browser window to see the effect.

## The CSS Box Model

In CSS, the term "box model" is used when talking about design and layout.

Explanation of the different parts:

- **Content** - The content of the box, where text and images appear
- **Padding** - Clears an area around the content. The padding is transparent
- **Border** - A border that goes around the padding and content
- **Margin** - Clears an area outside the border. The margin is transparent

The box model allows us to add a border around

```
<!DOCTYPE html>
<html>
<head>
<style>
div {
    background-color: lightgrey;
    width: 300px;
    border: 15px solid green;
    padding: 50px;
    margin: 20px;
}
</style>
</head>
<body>
```

**Demonstrating the Box Model**

The CSS box model is essentially a box that wraps around every HTML element. It consists of: borders, padding, margins, and the actual content.</p>

This text is the content of the box. We have added a 50px padding, 20px margin and a 15px green border. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum.

## Demonstrating the Box Model

The CSS box model is essentially a box that wraps around every HTML element. It consists of: borders, padding, margins, and the actual content.

This text is the content of the box. We have added a 50px padding, 20px margin and a 15px green border. proident, sunt in culpa qui  
officia deserunt mollit anim id  
est laborum.</div>  
  
</body>  
</html>
```

<b>CSS Text</b>	<pre>body {   color: blue; }  h1 {   color: green; }</pre>	
<b>CSS Text Alignment</b> <b>Text Alignment and Text Direction</b>  In this chapter you will learn about the following properties: <ul style="list-style-type: none"> <li>• <code>text-align</code></li> <li>• <code>text-align-last</code></li> <li>• <code>direction</code></li> <li>• <code>unicode-bidi</code></li> <li>• <code>vertical-align</code></li> </ul>	<pre>h1 {   text-align: center; }  h2 {   text-align: left; }  h3 {   text-align: right; }  div {   text-align: justify; }</pre>	

## CSS Text Decoration

### Text Decoration

In this chapter you will learn about the following properties:

- `text-decoration-line`
- `text-decoration-color`
- `text-decoration-style`
- `text-decoration-thickness`
- `text-decoration`

```
h1 {  
    text-decoration-line: overline;  
}  
  
h2 {  
    text-decoration-line: line-through;  
}  
  
h3 {  
    text-decoration-line: underline;  
}  
  
p {  
    text-decoration-line: overline underline;  
}
```

## CSS Fonts

### Font Selection is Important

Choosing the right font has a huge impact on how the readers experience a website.

The right font can create a strong identity for your brand.

Using a font that is easy to read is important. The font adds value to your text. It is also important to choose the correct color and text size for the font.

```
.p1 {  
    font-family: "Times New Roman", Times, serif;  
}
```

```
.p2 {  
    font-family: Arial, Helvetica, sans-serif;  
}
```

```
.p3 {  
    font-family: "Lucida Console", "Courier New", monospace;  
}
```

#### FONT STYLE

```
p.normal {  
    font-style: normal;  
}
```

```
p.italic {  
    font-style: italic;  
}
```

```
p.oblique {  
    font-style: oblique;  
}
```

#### FONT SIZE

```
h1 {  
    font-size: 40px;  
}  
  
h2 {  
    font-size: 30px;  
}  
  
p {  
    font-size: 14px;  
}
```

## CSS Links

### Styling Links

Links can be styled with any CSS property (e.g. `color`, `font-family`, `background`, etc.).

With CSS, links can be styled in many different ways.

Text Link

Text Link

Link Button

Link Button

## Styling Links

Links can be styled with any CSS property (e.g. `color`, `font-family`, `background`, etc.).

### Example

```
a {  
    color: hotpink;  
}
```

[Try it Yourself »](#)

In addition, links can be styled differently depending on what **state** they are in.

The four links states are:

- `a:link` - a normal, unvisited link
- `a:visited` - a link the user has visited
- `a:hover` - a link when the user mouses over it

```
<!DOCTYPE html>  
<html>  
<head>  
<style>  
/* unvisited link */  
a:link {  
    color: red;  
}  
  
/* visited link */  
a:visited {  
    color: green;  
}  
  
/* mouse over link */  
a:hover {  
    color: hotpink;  
}  
  
/* selected link */  
a:active {  
    color: blue;  
}  
</style>  
</head>  
<body>
```

- **a:active** - a link the moment it is clicked

```
<h2>Styling a link depending on state</h2>

<p><b><a href="default.asp"
target="_blank">This is a
link</a></b></p>
<p><b>Note:</b> a:hover MUST
come after a:link and a:visited
in the CSS definition in order
to be effective.</p>
<p><b>Note:</b> a:active MUST
come after a:hover in the CSS
definition in order to be
effective.</p>

</body>
</html>
```

## Text Decoration

The `text-decoration` property is mostly used to remove underlines from links:

```
<!DOCTYPE html>
<html>
<head>
<style>
a:link {
    text-decoration: none;
}

a:visited {
    text-decoration: none;
}

a:hover {
    text-decoration: underline;
}

a:active {
    text-decoration: underline;
}
</style>
</head>
<body>

<h2>Styling a link with text-decoration property</h2>
```

## Styling a link with `text-decoration` property

This is a link

Note: a:hover MUST come after a:link and a:visited in the CSS definition in order to be effective.

Note: a:active MUST come after a:hover in the CSS definition in order to be effective.

```
<p><b><a href="default.asp"
target="_blank">This is a
link</a></b></p>
<p><b>Note:</b> a:hover MUST
come after a:link and a:visited
in the CSS definition in order
to be effective.</p>
<p><b>Note:</b> a:active MUST
come after a:hover in the CSS
definition in order to be
effective.</p>

</body>
</html>
```

## CSS Forms

```
<!DOCTYPE html>
<html>
<head>
<style>
input[type=text] {
  width: 100%;
  padding: 12px 20px;
  margin: 8px 0;
  box-sizing: border-box;
}
</style>
</head>
<body>

<h2>Padded input fields</h2>

<form>
  <label for="fname">First
Name</label>
  <input type="text" id="fname"
name="fname">
  <label for="lname">Last
Name</label>
  <input type="text" id="lname"
name="lname">
</form>

</body>
</html>
```

### Padded input fields

First Name

Last Name

```
<!DOCTYPE html>
<html>
<style>
input[type=text], select {
    width: 100%;
    padding: 12px 20px;
    margin: 8px 0;
    display: inline-block;
    border: 1px solid #ccc;
    border-radius: 4px;
    box-sizing: border-box;
}

input[type=submit] {
    width: 100%;
    background-color: #4CAF50;
    color: white;
    padding: 14px 20px;
    margin: 8px 0;
    border: none;
    border-radius: 4px;
    cursor: pointer;
}

input[type=submit]:hover {
    background-color: #45a049;
}
```

#### Using CSS to style an HTML Form

The screenshot shows a web page titled "Using CSS to style an HTML Form". It contains three input fields: "First Name" (placeholder: "Your name.."), "Last Name" (placeholder: "Your last name.."), and "Country" (placeholder: "Australia"). Below the form is a large green button labeled "Submit".

```
}
```

```
div {
```

```
    border-radius: 5px;
```

```
    background-color: #f2f2f2;
```

```
    padding: 20px;
```

```
}
```

```
</style>
```

```
<body>
```

```
<h3>Using CSS to style an HTML
```

```
Form</h3>
```

```
<div>
```

```
    <form
```

```
action="/action_page.php">
```

```
        <label for="fname">First
```

```
Name</label>
```

```
        <input type="text"
```

```
id="fname" name="firstname"
```

```
placeholder="Your name..">
```

```
        <label for="lname">Last
```

```
Name</label>
```

```
        <input type="text"
```

```
id="lname" name="lastname"
```

```
placeholder="Your last name..">
```

```
        <label
```

```
for="country">Country</label>
```

```
<select id="country"
name="country">
    <option
value="australia">Australia</option>
    <option
value="canada">Canada</option>
    <option
value="usa">USA</option>
</select>

    <input type="submit"
value="Submit">
</form>
</div>

</body>
</html>
```

# JavaScript Tutorial

JavaScript is the world's most popular programming language.

JavaScript is the programming language of the Web.

JavaScript is easy to learn.

This tutorial will teach you JavaScript from basic to advanced.

## JavaScript Can Change HTML Content

One of many JavaScript HTML methods is `getElementById()`.

The example below "finds" an HTML element (with id="demo"), and changes the element content (innerHTML) to "Hello JavaScript":

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h2&gt;What Can JavaScript Do?&lt;/h2&gt;  &lt;p id="demo"&gt;JavaScript can change HTML content.&lt;/p&gt;  &lt;button type="button" onclick='document.getElementById("demo").innerHTML = "Hello JavaScript!"&gt;Click Me!&lt;/button&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>What Can JavaScript Do?</b></p> <p>JavaScript can change HTML content.</p> <p>Click Me!</p> <p><b>What Can JavaScript Do?</b></p> <p>Hello JavaScript!</p> <p>Click Me!</p>

```
<!DOCTYPE html>  
  
<html>  
  
<body>  
  
<h2>What Can JavaScript Do?</h2>  
  
<p>JavaScript can change HTML attribute values.</p>  
  
<p>In this case JavaScript changes the value of the src (source) attribute of an image.</p>  
  
<button  
onclick="document.getElementById('myImage').src  
='pic_bulbon.gif'">Turn on the light</button>  
  

```

## What Can JavaScript Do?

JavaScript can change HTML attribute values.

In this case JavaScript changes the value of the src (source) attribute of an image.

Turn on the light

Turn off the light

```
<button  
onclick="document.getElementById('myImage').src  
='pic_bulboff.gif'">Turn off the light</button>
```

```
</body>  
</html>
```

```
<!DOCTYPE html>  
  
<html>  
<body>  
  
<h2>What Can JavaScript Do?</h2>
```

## What Can JavaScript Do?

JavaScript can change HTML attribute values.

In this case JavaScript changes the value of the src (source) attribute of an image.

Turn on the light

Turn off the light

## What Can JavaScript Do?

JavaScript can change the style of an HTML element.

Click Me!

```
<p id="demo">JavaScript can change the style of  
an HTML element.</p>
```

```
<button type="button"  
onclick="document.getElementById('demo').style.fo  
ntSize='35px'">Click Me!</button>
```

```
</body>
```

```
</html>
```

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
<h2>What Can JavaScript Do?</h2>
```

```

```

```
<h2>JavaScript in Body</h2>
```

```
<p id="demo"></p>
```

```
<script>
```

```
document.getElementById("demo").innerHTML =  
"My First JavaScript";
```

```
</script>
```

```
</body>
```

```
</html>
```

## JavaScript in Body

My First JavaScript

# JavaScript Functions and Events

A JavaScript **function** is a block of JavaScript code, that can be executed when "called" for.

For example, a function can be called when an **event** occurs, like when the user clicks a button.

You will learn much more about functions and events in later chapters.

## JavaScript in <head> or <body>

You can place any number of scripts in an HTML document.

Scripts can be placed in the **<body>**, or in the **<head>** section of an HTML page, or in both.

## JavaScript in <head>

In this example, a JavaScript **function** is placed in the **<head>** section of an HTML page.

The function is invoked (called) when a button is clicked:

Code	Browser View
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;head&gt; &lt;script&gt; function myFunction() {   document.getElementById("demo").innerHTML = "Paragraph changed."; } &lt;/script&gt; &lt;/head&gt; &lt;body&gt;  &lt;h2&gt;Demo JavaScript in Head&lt;/h2&gt;  &lt;p id="demo"&gt;A Paragraph.&lt;/p&gt;  &lt;button type="button" onclick="myFunction()"&gt;Try it&lt;/button&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>Demo JavaScript in Head</b></p> <p>A Paragraph.</p> <p><a href="#">Try it</a></p> <p><b>Demo JavaScript in Head</b></p> <p>Paragraph changed.</p> <p><a href="#">Try it</a></p>

# JavaScript in <body>

In this example, a JavaScript **function** is placed in the <body> section of an HTML page.

The function is invoked (called) when a button is clicked:

Code	Browser View	
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;h2&gt;Demo JavaScript in Body&lt;/h2&gt; &lt;p id="demo"&gt;A Paragraph.&lt;/p&gt;  &lt;button type="button" onclick="myFunction()"&gt;Try it&lt;/button&gt;  &lt;script&gt; function myFunction() {   document.getElementById("demo").innerHTML = "Paragraph changed."; } &lt;/script&gt; &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>Demo JavaScript in Body</b></p> <p>A Paragraph.</p> <p><a href="#">Try it</a></p> <p><b>Demo JavaScript in Body</b></p> <p>Paragraph changed.</p> <p><a href="#">Try it</a></p>	

# External JavaScript

Scripts can also be placed in external files:

## External file: myScript.js

External scripts are practical when the same code is used in many different web pages.

JavaScript files have the file extension **.js**.

To use an external script, put the name of the script file in the `src` (source) attribute of a `<script>` tag:

Code	Browser View	
<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h2&gt;Demo External JavaScript&lt;/h2&gt;  &lt;p id="demo"&gt;A Paragraph.&lt;/p&gt;  &lt;button type="button" onclick="myFunction()"&gt;Try it&lt;/button&gt;</pre>	<p><b>Demo External JavaScript</b></p> <p>A Paragraph.</p> <p><a href="#">Try it</a></p> <p>This example links to "myScript.js".</p> <p>(myFunction is stored in "myScript.js")</p>	

```
<p>This example links to  
"myScript.js".</p>  
<p>(myFunction is stored in  
"myScript.js")</p>
```

```
<script src="myScript.js"></script>
```

```
</body>  
</html>
```

## Demo External JavaScript

Paragraph changed.

[Try it](#)

This example links to "myScript.js".

(myFunction is stored in "myScript.js")

# JavaScript Output

## JavaScript Display Possibilities

JavaScript can "display" data in different ways:

- Writing into an HTML element, using `innerHTML`.
- Writing into the HTML output using `document.write()`.
- Writing into an alert box, using `window.alert()`.
- Writing into the browser console, using `console.log()`.

	<b>Code</b>	<b>Browser View</b>
<p><b>Using innerHTML</b></p> <p>To access an HTML element, JavaScript can use the <code>document.getElementById(id)</code> method.</p> <p>The <code>id</code> attribute defines the HTML element. The <code>innerHTML</code> property defines the HTML content:</p>	<pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt;  &lt;h2&gt;My First Web Page&lt;/h2&gt; &lt;p&gt;My First Paragraph.&lt;/p&gt;  &lt;p id="demo"&gt;&lt;/p&gt;  &lt;script&gt; document.getElementById("demo").inne rHTML = 5 + 6; &lt;/script&gt;  &lt;/body&gt; &lt;/html&gt;</pre>	<p><b>My First Web Page</b></p> <p>My First Paragraph.</p> <p>11</p>

## Using `document.write()`

For testing purposes, it is convenient to use `document.write()`:

```
<!DOCTYPE html>
<html>
<body>

<h2>My First Web Page</h2>
<p>My first paragraph.</p>

<p>Never call document.write after the
document has finished loading.
It will overwrite the whole
document.</p>

<script>
document.write(5 + 6);
</script>

</body>
</html>
```

## My First Web Page

My first paragraph.

Never call `document.write` after the document has finished loading. It will overwrite the whole document.

11

Using `document.write()` after an HTML document is loaded, will **delete all existing HTML**:

The `document.write()` method should only be used for testing.

```
<!DOCTYPE html>
<html>
<body>

<h2>My First Web Page</h2>
<p>My first paragraph.</p>

<button type="button"
onclick="document.write(5 + 6)">Try
it</button>

</body>
</html>
```

## My First Web Page

My first paragraph.

Try it

11

## Using window.alert()

You can use an alert box to display data:

```
<!DOCTYPE html>
<html>
<body>

<h2>My First Web Page</h2>
<p>My first paragraph.</p>

<script>
window.alert(5 + 6);
</script>

</body>
</html>

<script>
alert(5 + 6);
</script>
```

## Using `console.log()`

For debugging purposes, you can call the `console.log()` method in the browser to display data.

```
<!DOCTYPE html>
<html>
<body>

<h2>Activate Debugging</h2>

<p>F12 on your keyboard will activate debugging.</p>
<p>Then select "Console" in the debugger menu.</p>
<p>Then click Run again.</p>

<script>
console.log(5 + 6);
</script>

</body>
</html>
```

### Activate Debugging

F12 on your keyboard will activate debugging.

Then select "Console" in the debugger menu.

Then click Run again.

# JavaScript Print

JavaScript does not have any print object or print methods.

You cannot access output devices from JavaScript.

The only exception is that you can call the `window.print()` method in the browser to print the content of the current window.

```
<!DOCTYPE html>
<html>
<body>

<h2>The window.print() Method</h2>

<p>Click the button to print the current page.</p>

<button onclick="window.print()">Print this page</button>

</body>
</html>
```

## The `window.print()` Method

Click the button to print the current page.

[Print this page](#)
